Maximum Circuit Values:  Grid-No.1-Circuit Resistance: For grid resistor-bias operation 1 max. megohm	
without external shield.  This value can be measured by a method involving a recurrent wave form such that the maximum ratings of the tube will not be exceeded.  As described in "Standards of Good Engineering Practice Concerning Television Broadcast Stations," Federal Communications Commission.  This rating is applicable where the duration of the voltage pulse does not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.  An adequate bias resistor or other means is required to protect the tube in the absence of excitation.  The dc component must not exceed 100 volts.	

\* APPLIES IN ZONE STARTING 0.375" FROM BASE SEAT.
